Introduction to Dify

Introduction to Dify
1. Course Content
2. Dify
    2.1 Introduction
    2.2 Features

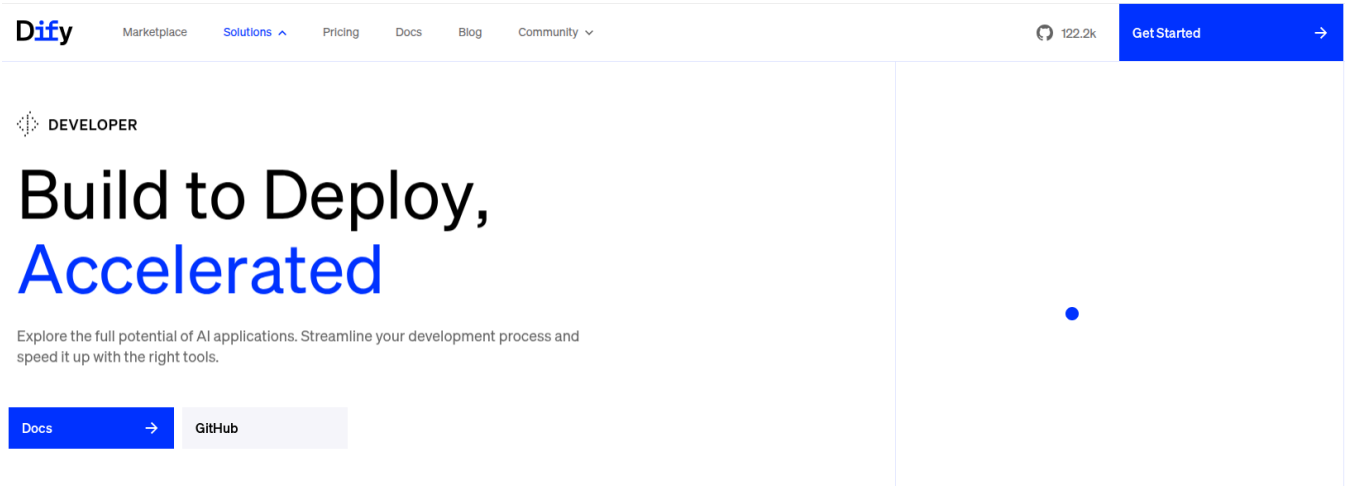

1. Course Content

- Learn about the basic features of Dify to facilitate the subsequent development of AI agents.

2. Dify

2.1 Introduction

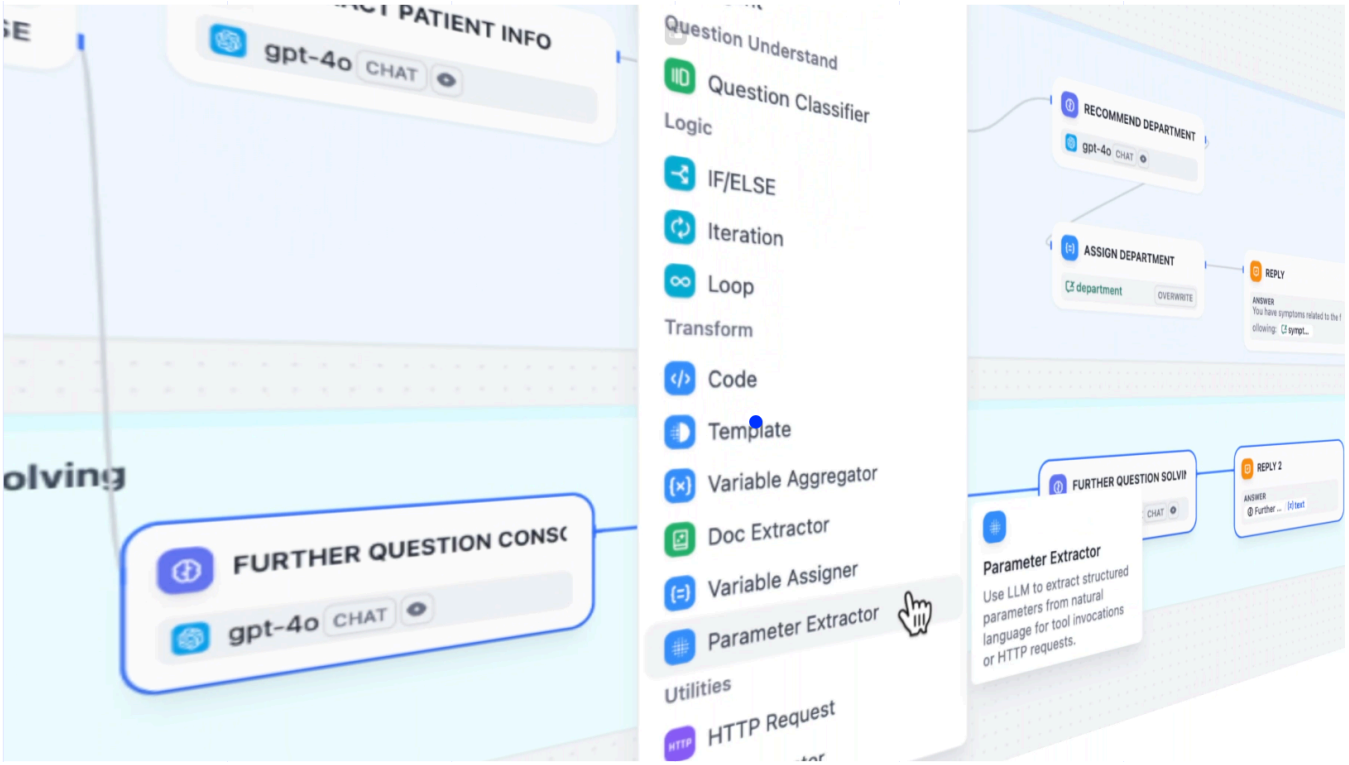

- Dify is an open-source development and deployment platform for **production-grade Agentic AI solutions**. Without any complex technical barriers, developers can quickly build, deploy, and scale AI applications.

2.2 Features

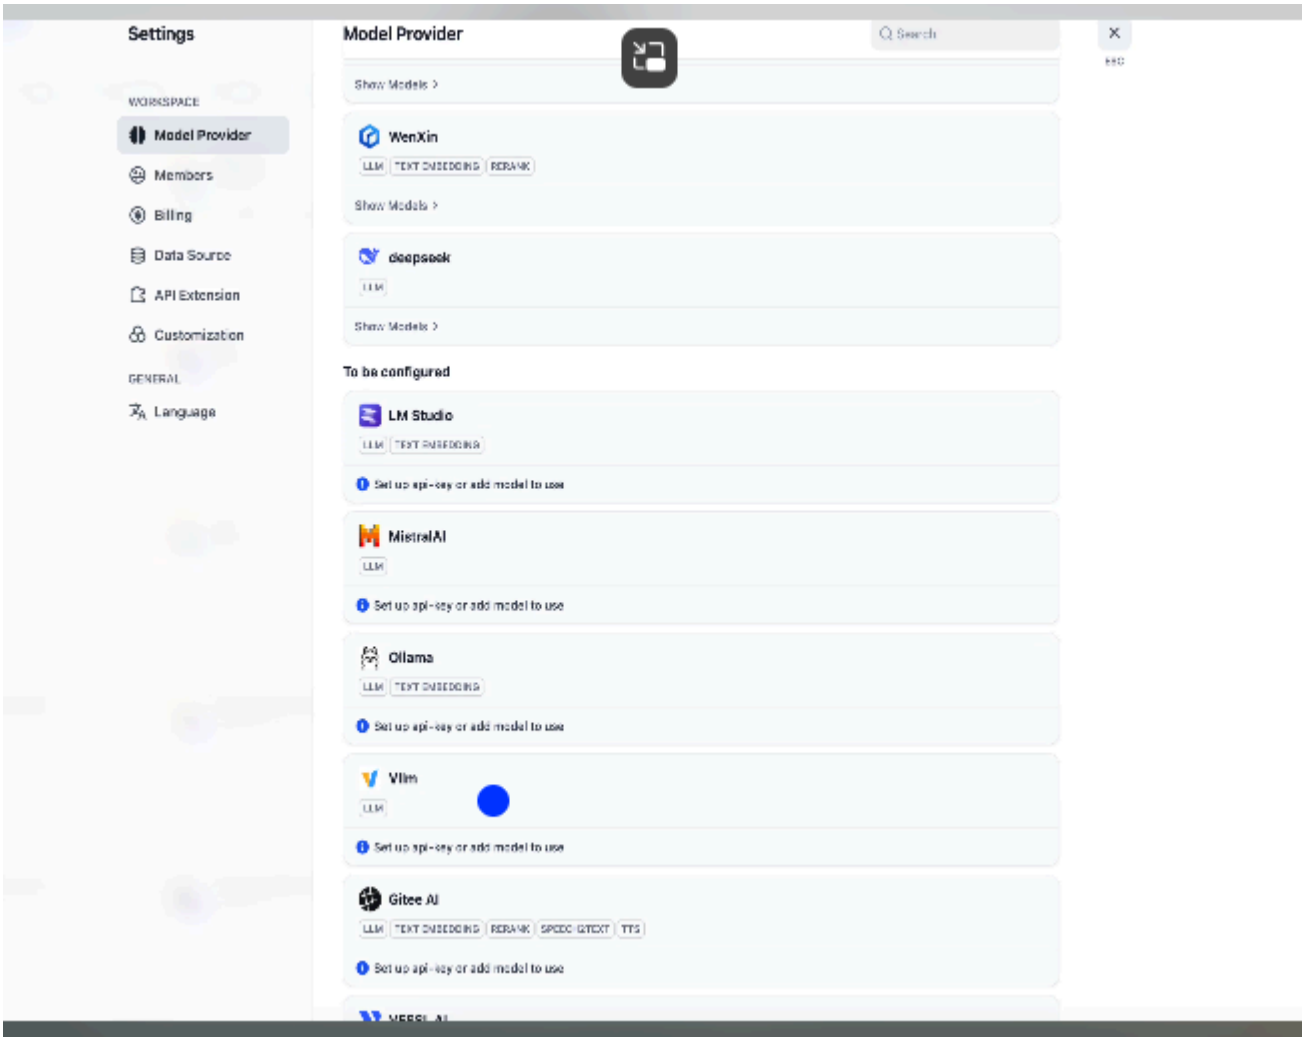

- Visual construction of AI applications

Through **drag-and-drop operations**, you can intuitively design AI workflows and applications, supporting the composition and nesting of complex logic. Without deep backend development, you can quickly go from concept to underlying logic and rapidly build powerful AI agent applications.

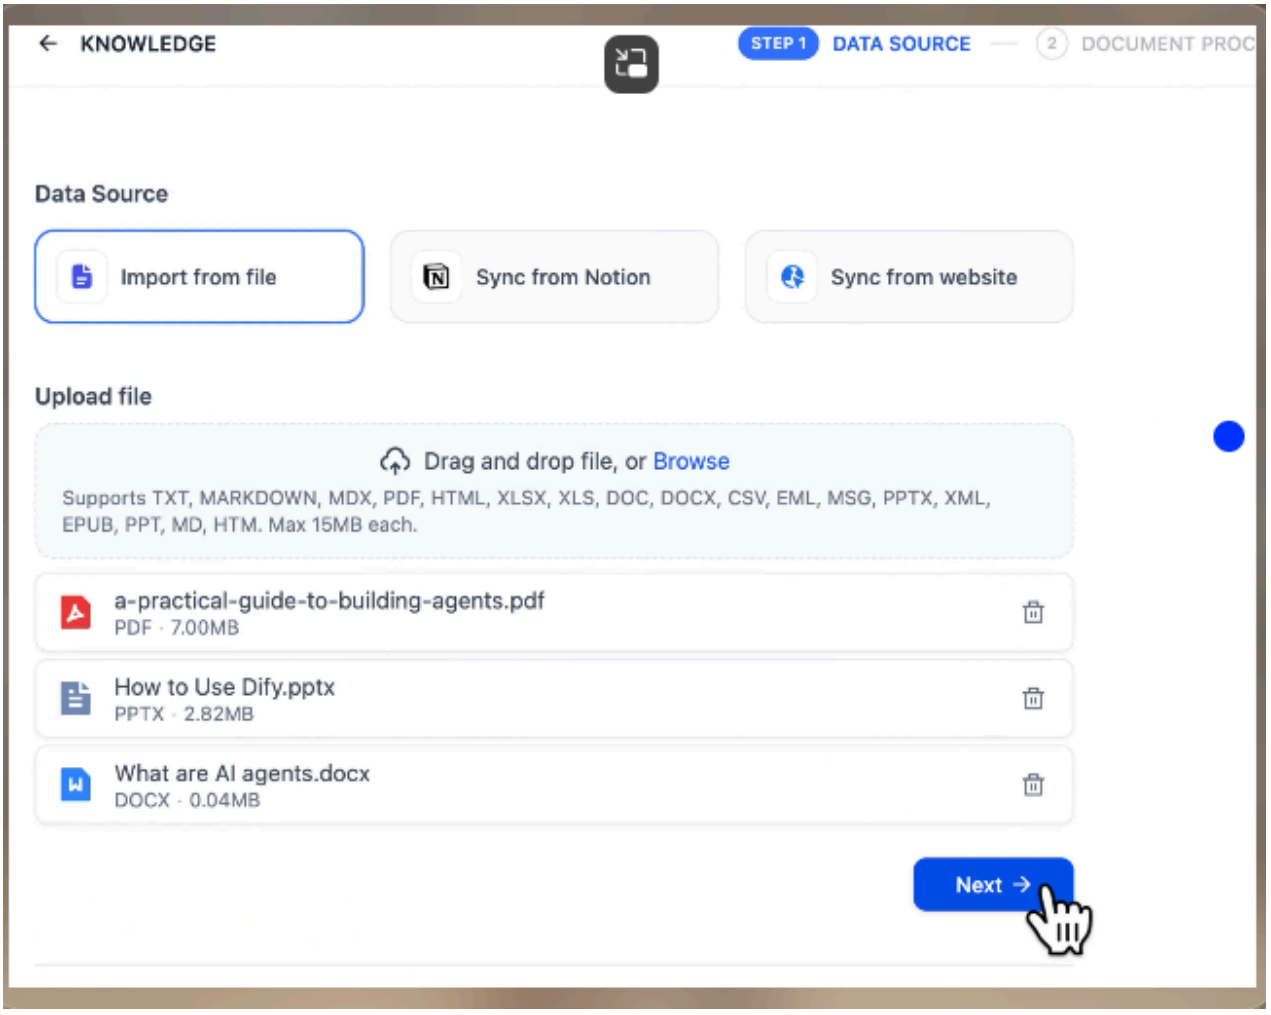

- Seamless integration with AI large models from global model providers

Simply apply for the API-KEY from the corresponding model provider and you can connect to hundreds of online model services with one click.

- Multi-source data support

  Dify can extract and transform data from diverse data sources, automatically build indexes, and store them in a vector database, providing efficient RAG (Retrieval-Augmented Generation) for large models. You can directly deploy a local RAG knowledge base.

- Rich plugin system

With Dify's rich plugin system, AI large models can be combined with tools and RAG knowledge bases to become AI agents, providing support for AI applications across different vertical domains.
